02/02/2026

ITIL 4

ITIL: Information technology and Infrastructure Library.

ITIL 4 provides a Digital operation model that enables organizations to co-create effective value from their IT- supported product and services.

ITIL 4 builds on ITIL's decades of progress, evolving stabilization ITSM practices for the wider context of customer experience, value streams, and digital transformation.

ITIL 4 also promotes greater establishment…

WHAT IS ITIL 4?

Popular IT services covered by ITIL are Cloud services, backup, network security, Data processing and storage, managing print services, IT consulting, help desk support, IOT etc.

The systematic and structured approach of ITIL framework helps an organization in managing…

WHY IS ITIL REQUUIRED:

- improving project delivery success.
- managing constant business and IT change.
- Offering maximum value to customer.
- Enhancing resources and capabilities.
- Providing services that are Useful and reliable.
- Planning process with the specific goals in mind.
- Clearly defines roles for each task.
- Deliver value for customers through services.
- Integrate business and service strategies.
- Monitor
- It helps to control IT investment and budgets.
- Change the organization culture.
- Improve the relationship with customers.

- Service management best practices.
- Better management of services and integration.
- Business services IT Functions.
- IT and business planning.
- Aligning and Integrating IT and business goals.
- Obtaining and retaining the right resources and Skillsets.
- Measuring IT organization effectiveness.
- Developing business and IT relationships and partnerships.

HISTORY OF ITIL:

- ITIL was first published in 1990
- It was republished on 1995.ITIL
- ITIL was introduced to north America in 1997.
- In 2002, V2 process- based book introduced
- In 2005, work for version 3 begun
- In 2007 , V3 with 5 book ISO 20000 was launched
- In 2011, upgraded version of V3 was released.
- In 2019 , ITIL V4 was released.

Features of ITIL:

- One language/ terminology.
- ITIL is a means to deliver consistent quality.
- Focus on IT. However, it is just not only sustainable for IT.
- Existing activities and how to optimize them.
- Related process and task (Roles).

WHAT IS ITIL IS NOT?

- ITIL is not a complete blueprint, but just bricks and material from which you can build your own building depending upon your business needs.
- It is not a quick fix, but a set of processes that you need to build into the mind- set of employees, and that must be continually updated and improved.
- It is not only another method of control but a way of setting up your organization.

Advantages of ITIL:

- Increase customer satisfaction.
- Improve service availability.
- Financial management.

- Allows you to improve the decision making process.
- Help you to create infrastructure services.
- Helps to create a clear structure of an organization.

APPLICATION OF ITIL:

- IT and business strategic planning.
- Implementing continuous improvement.
- Obtaining and retaining the right resources and skillsets.
- Reducing total cost and overall cost of ownership.
- Demonstrating the business value to it.
- Helps you to measure IT organization effectiveness and efficiency.

ITSM: IT service Management

ISO: International organization for standardization

SERVICE MANAGAEMENT:

Service management is a set of specialized organizational capacities that enable value to customers in the form of services.

To develop specialized organization capabilities, you must understand:

- The nature if value.
- The nature and scope of stakeholders.

Value:
The purpose of an organization is to create a **value** for stakeholders.

Value Co-Creation:

Traditional view of value delivery by Organization

=

A delivery company delivering a package to its customers

Service provider– Organization s that deliver service are caller Service Provider

Service Consumer- Those receiving services are Service Consumers.

ORGANIZATION- A person or a group of people with its own function and objectives.

SERVICE PROVIDERS: A provider sells service in the open market to other business and individual consumers.

SERVICE CONSUMERS: A generic role that simplifies the definition and description of the structure of service relationships.

SERVICE CUSTOMER ROLES:

- **CUSTOMER:** The role that defines the requirements of a service and takes responsibilities for the outcome of service consumption.
- **USER :**
- **SPONSOR:**

Stakeholders	**Examples of value for stakeholders**
Service	Achieved benefits and optimized costs and risks
Service provider	Funding from the customer, business development, and image improvement
Service provider employees	Financial and non- financial incentives, career and professional development, and a sense of purpose.
Society and community	Employment, taxes, and organizations' contribution to the development of the community
Charity organizations	Financial and non-financial contributions from other organizations
Stakeholders	

PRODUCT AND SERVICES

Product – It is a configuration of a organization's resources designed to offer value to consumers.

Service- It co-creates value by facilitating outcome that customers want to achieve without having to manage specific costs and risk.

SERVICE OFFERINGS:

Service offerings are the description of one or more services designed to address the needs of a target consumer group. It includes goods, access to resources, and service actions.

Component	Description	Example
Goods	- Supplied to the customer - Ownership is transferred to the consumer. - Consumer takes responsibility for future use	- A mobile phone - A physical server
Access to resources	- Ownership is not transferred to the consumer. - Access is granted to the consumer under agreed terms and conditions. - The consumer can inky access the resources during the agreed consumption period.	- Access to a mobile network or to network storage.
Service actions	- Performed by the service provider to address a consumer's need. - Performed accordingly to an agreement with the consumer	- User support, replacement of a piece of equipment.

Service Relationships:

Service relationships are established between two or more organizations to co-create value.

In service relationship, organizations take the rules of service providers or service consumers.

- Service relationships are defined as the cooperation between service providers and service consumers.
  Ex- OLA and UBER.

Service relationship Management -

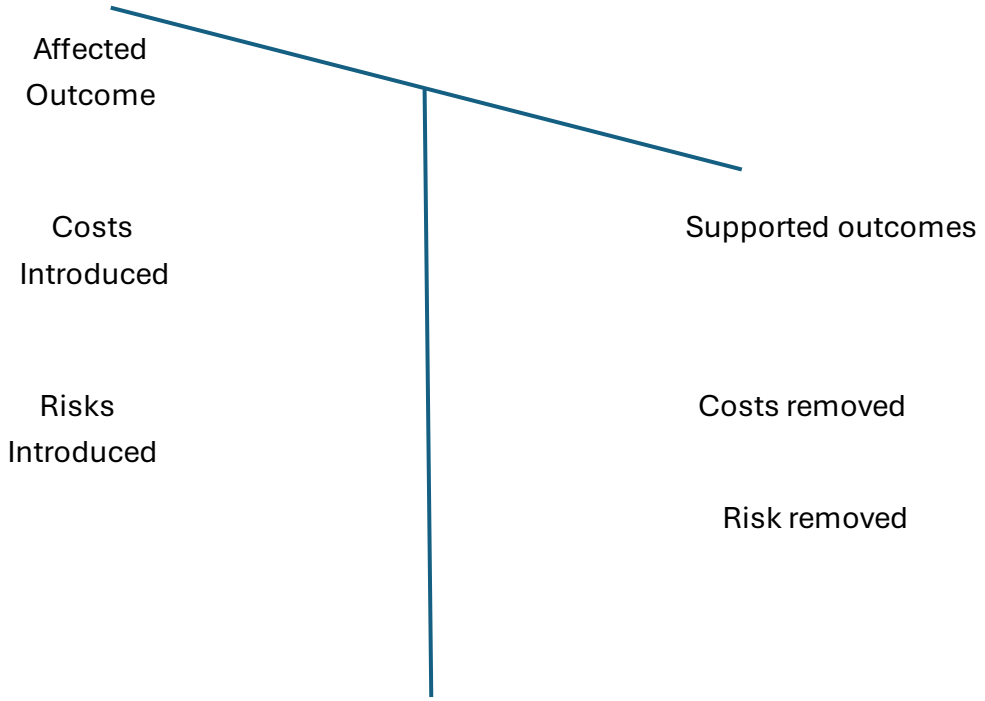
These are joint activities performed by service providers and service consumers to ensure continual value co- creation.

VALUE: OUTCOME, COSTS AND RISKS

Requires Associated with

Outcomes ----------→ Resources----------→ Costs----------→ Risks

Outcomes: Service relationships are predicted as valuable only when they have more positive effects.



OUTPUTS AND OUTCOME:

A service provider organization produces outputs that helps its consumers to achieve certain outcome.

- **Outputs**: A tangible or intangible deliverable of an activity.
- **Outcome**: a result for a stakeholder enabled by one or more outputs.

COST – Cost is the amount of money spent on a specific activity or resource. It can be expressed in non- monetary terms, such as time spent, people allocated, and so on.

RISKS - Risk is a possible event that could cause harm or loss or make it more difficult to achieve objectives.

TYPE OF RISKS-

Risk removed from a consumer by the service:
- These may include: failure of the consumer's server hardware , lack of staff availability.
- .....

Managing Risks:

A service provider should manage the details level of risk on behalf of the consumer.

The consumer contributes to the reduction of risk through:

Actively participating in the definition of the requirements of the service and the clarity of its required outcomes	Clearly communicating the critical success factors(CSFs) and constrains that apply to the Service.	Ensuring the provider has access to the necessary resources of the customer through out the service relationship.

UTILITY AND WARRENTY-

Asses the overall utility and warranty of the service to evaluate whether a service or service offering will facilitate the outcomes desired by the consumers and therefore create value for them.

UTILITY	WARRENTY
- Summarized as "what the service does" - Determines whether a service is "fit for purpose" - A service must either support the performance of the consumer or remove constrains from the consumer to have utility.	- Summerize as how the service performs - Determines whether service is "fit for use"
	-

<u>03/03/2026-</u>

FOUR DIMENTIONS OF SERVICE MANAGEMENT

ITIL defines four dimensions that are critical to the effectiveness and efficient facilitation of value to customers and other stakeholders.

1- Organizations and people
2- Information and technology
3- Partner and supplier
4- Value streams and processes

Factors- Every dimension is affected by multiple factors. (Economical factor, Social factor, technological factor, Legal factor, Environmental factor, political factor)-

- They represent perspective relevant to the service value system (SVS)
- They are constrained by several external factors that are beyond the control of the SVS.
- They must be addressed by the organizations to meet the expectations of the quality or efficiency.
- The four dimensions do not have sharp boundaries and may overlap.

1- ORGANIZATIONS AND PEOPLE

The organizations and people dimension of a service management covers

Roles and responsibilities>>>>> Formal organizational structure>>>Culture>>>Staffing and competencies

An organization should ensure that its structure and management is well- defined and supports its overall strategy and operating models.

- System of authority
- Roles and responsibilities
- Workforce capacity and competence
- Culture

} Organizations

A leader advocates values that help and motivate people to work in desirable ways.

- Creates shared values and attitudes
- Promotes a culture of trust and transparency
- Facilitates communication

- Management and leadership styles
- Communication and collaboration
- Update skill and competencies
- Interface between specializations and roles
- Levels of collaboration and coordination
- Broad knowledge and deep specialization

} PEOPLE

2- INFOMATIONS AND TECHNOLOGY

The second dimension is information and technology. It applies both to service and management and the service being managed.

When applied to the SVS, the information and technology dimension includes:

- Information and knowledge
- Technology
- Relationships between the components

- Workflow management
- Knowledge bases
- Communication systems
- Analytical tools
- Inventory systems
- Remote collaboration
- Mobile platforms
- Artificial
- Cloud solutions
- Machine learning

TECHNICAL SUPPORTING SERVICE MANAGEMENT

- IT architecture
- Applications
- Database
- Communication systems
- Blockchains
- Artificial intelligence
- Cognitive computing
- Cloud computing
- Mobile applications

TECHNOLOGY SUPPORTING IT SERVICES

Information management is primary means of delivering customer value.

- Availability
- Reliability
- Accessibility
- Timeliness
- Accuracy
- Relevance

INFORMATION CRITARIA

The Information and technology dimension focuses on the challenges of information management such as security and regulatory compliance requirements.

Organizations must consider how information is exchanged between different services and service components.

An organization may be subject to European Union's GDPR(General Data protection Regulation), which influences its information management policies and practices.

Other industries may have regulations that impose constraints on the collection and management of Data.

The health Insurance portability and Accountability Act of 1996 provides data privacy and security provisions doe safeguarding medical information in the US.

Selecting the correct Technology.

Information technology considerations

Is it compatible with the current architecture?	Does the organization have the right skills to support and maintain it?
Does it raise any regulatory, compliance, or information security control issues?	Does it have sufficient automation capabilities to be developed, deployed, and operated?
Will it continue to be viable in the foreseeable future?	Does it have additional capabilities that can be leveraged for other products or services?
Does it align with the service provider or service consumer strategy?	Does it introduce new risks or constraints to the organization?

Factors Influencing Technology:

Culture	Nature of the business
- Some organizations are more interested than others in being technologically advanced. - Other organizations focus on a more traditional way of working.	- A company with government clients may have restrictions on the use of some technologies. - Industries such as finance or life

3- PARTNER AND SUPPLERS

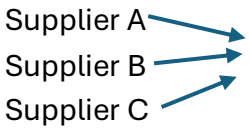
Every organization and service depends on provided by the organizations to some extent.

goes hand in hand

SERVICE PARTNERSHIPS>>>>>>>>>>>>>>>>>>GOODS AND SEVICE SUPPLY

The partners and suppliers dimensions encompasses an organization's relationships with other organizations.

An organization can use the service integrations and management method to address the partner and suppliers' dimension.



PARTNERS AND SUPPLIERS

FORM OF COOPERATION	OUTPUTS	RESPONSIBILITY FOR THE OUTPUTS	RESPONSIBLE FOR ACHIVEMENTS FOR THE OUTCOMES	LEVEL OF FORMALITY	EXAMPLE
Good supply	Goods supplied	Supplier	Customer	Formal supply contract/ invoices	Procurement of computers and phones
Service delivery	Services delivered	Provider	Customer	Formal agreements and flexible cases	Cloud computing (infrastructure of platform as a service)
Service partnership	Value co-create	Shared between provider and customer	Shared between provider and customer	Shared Goals, generic agreements, flexible case-based arrangements	Employee onboarding (shared between HR, facilities, and IT)

ORGANIZATIONAL STRATEGY

An organizations' strategy for choosing partners and supplier should be based on its goals, culture, and business environment.

- Some organizations focus on developing core competencies through

FACTORS INFLUENCING ORGANIZATIONAL STRATEGY

- Strategic Focus
- Corporate culture
- Resource scarcity
- Cost Concerns
- Subject matter expertise
- External constraints
- Demand patterns

} ORGANIZATIONAL STRATEGY

CLOUD COMPUTING:

It is a model for enabling on – demand network access to a shared pool of configurable computing resources that can be rapidly provided with the minimal management effort or provider interaction.

ITSM in the modern World: Cloud computing

Key Characteristics of Cloud computing:

- On- Demand availability
- Network access
- Resource pooling
- Rapid elasticity
- Measured service

4- VALUE STEAMS AND PROCESSES

The fourth dimension of service management is value steams and processes. They define the activities, workflow, control, and procedure to achieve the agreed objective.

It is considered with how the various parts of the organization work in an integrated and coordinated way to enable value creation through products and services.

It focuses on:

- What activities the organization undertakes?
- How activities are organized
- How value creation is ensure all

VALUE STREAMS:

A value stream is a series of steps an organization undertakes to create and deliver products and service to customers. It combines the organization's value chain activities.

Benefits of Value stream:

- Value stream provides a clear picture of what an organization delivers and how to make continual improvements to its services.
- An organization can map their work with the identified value stream map to analyze their current state and identify barriers and non-value adding activities.
- Opportunities to increase value-adding activities can be found across the service value chain.
- Value stream optimization includes process automation or adaptation of emerging technologies to gain efficiencies or enhance user experience.
- Value streams can be refined to react to changing demands or remain stable for a significant amount of time.

PROCESSED:

A process is a set of interrelated activities that transform input into output. Processes define the sequence of activities and their dependencies.

Input >>>>>> Activities>>>>>>>Output

EXTERNAL FACTORS:

Service providers are affected by external factors that exhibit high degrees of violation and impose constraints.

EXTERNAL FACTORS: PESTLE

Collectively, these factors influence how organizations configure their resources and address the four dimensions of service management.

P – Political: Government policies, political stability, trade policies, and tax policies

E – Economic: Economic growth, inflation, exchange rates, and government subsides.

S – Social: Demographic trends, culture norms, and public attitudes towards technology and services.

T – Technical: technological advancements, the pace of change and new innovations that could affect the business.

L – Legal: regulations related to employment, consumer protection, health and safety, and data privacy.

E – Environmental: Climate change, weather patterns and environmental regulations that could impact operations.

ITIL SERVICE VALUE SYSTEM

The ITIL service value system (SVS) describes how all the components are activities of the organization work together as a system to enable value creation.

Opportunity (Governance)
or >>>>>>>>>>>>>>>>> Service Value chain>>>>>>>>>>>>>>>>>> Value
Demand (Guiding principles)

SVS ensures that the organization continually co-creates value with all stakeholders through the use of product and services.

- The component, activities, and organizations' resources can be configured in multiple combinations
- This requires coordination

Opportunities represent the possibilities of adding value to stake holder or improving the organization.

OPPORTUNITY, DEMAND AND VALUE:

Opportunity and demand trigger activities within the ITIL SVS that lead to value creation.

- Opportunity can trigger work within the system even when there is no demand.
- Organization should prioritize new or change services with opportunities for improvement to ensure there resources are correctly allocated.

COMPONENTS OF SVS:

- Guiding principles guide an organization in all circumstances.
- Governance refers to the means by which an organization Is directed and controlled.
- Service value chain is a set of interconnected activities that an organization performs to deliver a valuable product.
- thin
- Continual improvement is a recurring organizational activity perform at all levels.

SILOED ORGANIZATIONS:

Organizational Siloed are a challenge to organizations.

- Resistance to change
- Difficulty in accessing information and specialized

SEVEN GUIDING PRINCIPLES:

- **Focus on value**
- **Start where you are**
- **Progress iteratively with feed back**
- **Collaborate and promote visibility**
- **Think and work holistically**
- **Keep it simple and practical**
- **Optimize and automate**

Focus on value:

The organization should create value for itself, its customers and other stakeholders.

Start Where you are:

Before starting an improvement initiative, consider what is already available to be leverage.

Progress Iteratively with feedback:

Organize work into small, manageable sections to execute them in a timely manner.

GOVERNANCE:

Governance is realized through the following activities:

Evaluate: the governing body evaluates the organization on a regular basis as stakeholders' need and external circumstances evolve.

Direct: the governing body assigns responsibility for, and directs the preparation and implementation of organizational strategy and policies.

Monitor: the governing body monitors the performance of the organization.

SVS Governance-

The governing body needs to make sure that:

- Both the governing body and management at all levels maintain alignment through a clear set of shared principles and objectives.
- The governance and management at all levels and

THE SERVICE VALUE CHAIN(SVC)

The service value chain is an operating model that outlines the key activities required to respond to demand.

Demand >> Engage >> Plan>> Design and transition>> Obtain or build >> Deliver and support >> Improve (24 x 7 process) >> product and services >> value >>> Demand.

Each activity contributes to the value chain by transforming specific ....

PLAN: plan value chain activity ensures a shared understanding of the vision, current status, and improvement direction for all products and services.

Input:

- Policies, requirements, and constraints.
- Consolidated demand and opportunities.
- Value chain performance information, improvement initiatives, and plans.
- Improvement status reports.
- Knowledge and information

Improve: improve value chain activity ensures continual improvement of product, service, and practices across all value chain activities and the four dimensions of service management.

Engage: this activity provides a good understanding of continual engagement, transparency, and promotes good relationships with all stakeholders.

Design and transition: this activity ensures that the product and services continually meet stakeholder expectations of quality, costs and time to market.

Obtain or Build: This activity ensures that the service components are available and meet the agreed specifications.

Deliver and support: this activity ensures that services are delivered and supported according to the agreed specifications and stakeholders' expectations.

04/03/2026

ITIL management Practices

General management Practices	Service Management Practices	Technical management Practices
- Continual Improvement* - Information Security management - Relationship Management - Supplier Management	- Change Enablement* - Incident Management* - IT Asset management - Monitoring and event Management - Problem management* - Release Management - Service configuration management. - Service desk* - Service level management* - Service request management*	- Deployment management

TERM	DEFINITION
IT Asset	Any financially valuable component that contributes to the delivery of an IT product or service
Event	Any change of state that has significance for the management of a service or other configuration item(CI)
Configuration item	Any component that needs to be managed in order to deliver an IT service
Change	The addition, modification, or removal of anything that could have a direct or indirect effect on service
Incident	An unplanned interruption to a service or reduction in the quality of a service
Problem	A cause, or potential cause, of one or more incidents
Known Knowledge	A problem that has been analyzed but has not been resolved.

Continual Improvement:

A recurring Organizational activity preformed at all levels to ensure that an organization's performance continually meets the stakeholders' expectations.

The continual improvement model applies to the SVS in its entirely and to all of the organization's products, service, service components, and relationships.

To support continual improvement at all levels, the ITIL SVS includes:

- ITIL continual improvement model
- The continual improvement practice
- The improve service value chain activity

- It can be used as high level guide to support improvement initiatives
- It puts a strong focus on customer value.
- It enables that improvement efforts can be linked back to the organization's vision.
- It also supports an interactive approach to improvement, dividing work into manageable pieces with separate goals that can be achieved incrementally.

Continual Improvement Model:

	What is the vision?	<<	>>Business vision, mission goals and objective
How do we keep the momentum going?	Where are we now?	<<	>>Perform baseline assessments
	Where do we want to be?	<<	>>Define measurable target
	How do we get there?	<<	>>Define improvement plan
	Take action	<<	>>Execute improvement action
	Did we get there?	<<	>>Evaluate Metrics AND KPI

Continual Improvement Practice:

It aligns the organization's practice and services with changing business needs through:

- The ongoing improvement of product, service, and practices.

- Or, any element involved in the management of product and services.

It is the development of the improvement- related methods and techniques and the propagation of a continual improvement culture across the organization, in alignment with the organization's overall strategy.

Key activities:

- Encourage continual improvement across the organization.
- Secure time and budget for continual improvement
- Identify and log improvement opportunities
- Access and prioritize improvement action
- Plan and implement improvements
- Measure and evaluate improvement actions
- Coordinate improvement activities across the organization.

INFORMATION SECURITY MANAGEMENT

The Purpose of the information security management practice is to protect the information needed by the organization to conduct its business.

The required security is established by means of policies, processes, behavior, risk management, and controls, which must maintain a balance between:

- Prevention: Ensure that security incidents do not occur
- Detection: Prevents rapid and reliable detection of incidents.
- Correction: Recovers from incidents after they are detected.

Example – Antivirus.

Information security management interacts with every other practices.

- It creates control that each practice must consider when planning the work to be done.
- It is critically depended on behavior of people throughout the organization.
- It requires proper training to ensure people understand the information security policy.

RELATIONSHIP MANAGEMENT:

The purpose of relationship management practice is to establish and nurture the links between the organization and its stakeholders at strategic and tactical levels.

SUPPLIER AND MANAGEMENT

The purpose of the supplier management practice is to ensure that the organizations' suppliers and their performance are managed appropriately to support the seamless provision of quality products and services.

Activities that are central to the practice include:

- Create a single point of visibility and control to ensure consistency.
- Maintaining a supplier strategy, policy, and contract management information.
- Negotiating and agreeing contracts and arrangements.
- Managing relationships and contracts with the internal and external supplier.
- Managing supplier performance.

Sourcing, supplier strategy, and relationships:

The supplier strategy defines the organizations plan on how it will leverage the contribution of supplier in the achievement of its overall service management strategy.

A successful sourcing strategy requires a thorough understanding of an organization's objectives, the resources required to deliver that strategy, the environmental factors and the risk associated with implementing specific approaches.

Different types of supplier relationships between an organization and its suppliers that need to be considered as part of the organization's sourcing strategy include:

- Insourcing
- Outsourcing
- Single source/ Partnership
- Multisource

Change Enablement

The purpose is to maximize the number of successful IT changes by ensuring that risk has been properly assessed, authorizing change to proceed, and managing the change schedule.

The scope includes:

- All IT infrastructure.
- Application
- Documentation
- Processes
- Supplier relationship

Three types of change:

- Standard changes: These are low- risk, preauthorized changes that are well understood and fully documented, and can be implemented without any additional authorization.
- Normal changes- These are changes that need to be scheduled, assessed, and authorized in order to follow a standard process.
- Emergency changes – These are changes that must be implemented as soon as possible; for example, to resolve an incident or implement a security patch.

INCIDENT MANAGEMENT

THE PURPOSE IS TO MINIMIZE THE NEGATIVE IMPACT OF INCIDENT BY RESTORING NORMAL SERVICE OPERATION AS QUICKLY AS POSSIBLE.

- Log and manage every incident to ensure that it is resolved in time and meets the expectations of the customer and user.
- Agree, document, and communicate target resolution times to ensure that expectations are realistic.
- Prioritize incidents based on a agreed classification to ensure that incidents with the highest business impact are resolved first.
- Store information about incidents under incident records in a suitable tool.
- Update the incident's process on timely basis.

IT ASSET MANAGEMENT

The purpose of IT asset management practice is to plan and manage the complete lifecycle of all IT assets to help the organization to:

- Maximize value
- Control costs
- Manage risks
- Support decision-making about purchase, re-use, retirement, and disposal of asset.
- Meet regulatory and contractual requirements.

The scope of IT asset management includes all software, hardware, network, cloud service and client device. In some cases, it may also include non- IT assets such as building

Asset management is a well- established practice that includes the acquisition, operated, care, and disposal of organizational assets, particularly critical infrastructure.

The two type of asset management includes:

- IT asset management (ITAM)- this is a sub- practice of asset management that is specifically aimed at managing the lifestyle and total costs of IT equipment and infrastructure.
- Software asset management- this is a infrastructure and process necessary for the effective management, control, and protection of the software asset within an organization, throughout all stage of their lifecycle.

MONITORING & EVENT MANAGEMENT:

The purpose is to systematically observe services and service component ,and record and report the selected changes of state, identify as events.
the processes and procedures needed in the monitoring and event management practice must address the key activities:

- Identify what services, system, CIs , or other service components should be monitored, and established the monitoring strategy.
- Implement and maintain monitoring , leverage both the native monitoring feature of the elements being observed as well as the use of designed-for – purpose monitoring tools.

PROBLEM MANAGEMENT:

Problem management reduces the likelihood and impact of incidents by identifying the actual and potential causes of incident, and manages workarounds and known errors.

- Problem: It is the cause, or a potential cause, of one or more incidents.
- Known error:
- It is a problem that has been analyzed but has not been resolved.

Problem management>>> Problem control >>> Error control

When a problem cannot be resolved quickly, it is often useful..

RELEASE MANAGEMENT:

The purpose is to make new or changed service or features available for use.

Release is a version of service or other configuration item, or a collection of configuration items, that is made available for use.

SERVICE CONFIGURATION MANAGEMENT:

The purpose is to ensure that accurate and reliable information about the configuration of services, and the CIs that support them, is available when and where it is needed.

SERVICE DESK:

The purpose is to capture demand for incident resolution and service requests. It should also be the entry point and single point of contact for the service provider with all its users.

Service desks provide a clear path for users to report issues, queries, and requests; and have them acknowledged, classified, owner, and actioned.

Supporting technologies for a centralized service desk:

- Intelligent telephonic system
- Workforce management
- Call recording and quality control
- Dashboarding and monitoring tools
- Workflow systems
- Knowledge systems
- Knowledge base
- Remote access tools
- Configuration management systems

SERVICE LEVEL MANAGEMENT:

The purpose is to set a clear business-based targets for service levels, and ensure the delivery of service is properly assessed, monitored, and managed against these targets.

SERVICE LEVEL AGREEMENT:

Service level agreement is a documented agreement between a service provider and a customer that identifies both services required and the expected level of service.

Key requirements for successful SLA:

- Must be related to a defined service in the service catalogue

- Should relate to defined outcomes and not operational metrics
- Must reflect an agreement
- Must be simply written and easy to understand and use for all parties

Service level management involves collating and analyzing information from a number of sources, including:

- Customer engagement
- Customer feedback
- Operational metrics
- Business metrics

SERVICE REQUEST MANAGEMENT:

The purpose is to support the agreed quality of a service by handling all predefined, user – initiated service request in an effective and user friendly manner.

A service request includes:

- Request for service delivery actions
- Request for information
- Request for provision of a resource or service
- Request for access to a resource or service
- Feedback, compliment and complaints

DEVELOPMENT MANAGEMENT:

The purpose is to move new or changed hardware, software, documentation, purpose, or any other component to live environments.

There are a number of distinct approaches that can be used for a development.

Many organizations use a combination of these approaches, depending on their specific services and requirements as well as the release size, types, and impacts.

- Phased deployment
- Continuous delivery
- Big bang deployment
- Pull deployment
